Speed MatchThe Speed Match brain game seeks to improve your ability to process information and react quickly, causing you to recognize matching patterns in a rapidly evolving array of graphics. Memory Matrix The Memory Matrix brain game seeks to boost your memory, causing you to a new twist on the old game of concentration. It gets harder in a hurry! Brain games, we've been told, are a lot like exercise. You can do them because you care about yourself, and you want to invest in your body, and enjoy the self-just glow of a better working memory and higher IQ. But do they really work? A new meta-analysis of 23 different studies on memory training is pushing the scientific community to question the very basis of the idea that memory games improve reasoning in everyone from ADHD sufferers to the elderly. In the New Yorker, Gareth Cook explains: The meta-analysis found that education does no one much good. If anything, scientific literature tends to overestimate the results, because groups that find nothing tend not to publish their papers. (This is known as the filedrawer effect.) A zero result from the meta-analysis, published in a leading journal, sends a shudder through the spine of all but the truest of believers. No biggie-that's what the scientific process is about, is it? The problem is that brain education has flourished in a multimillion-dollar industry. Companies like CogMed sell the idea that their games can improve the intellectual flexibility of customers, including those with learning disabilities. This is a morally ambiguous business model: The responsibility is so heavy because the needs are so Many people who have suffered brain trauma are haunted by a feeling of decline and a frustration that they cannot do more to help themselves. There are millions of children with learning disabilities who feel lost and ashamed. And then there are all the seniors who struggle with mental diffusion. These are the customers. These new studies show that brain training helps you improve certain skills, so there is nothing wrong with playing brain games. Selling them as a miracle cure damaged or disabled brains? That's more problematic. Read the full story here. [PICTURE: Face via Shutterstock] the Foc.us gaming headset, designed to shock your brain with electrodes-anything to improve a high score, right?-has received FCC certification, but still lacks all the major FDA approval. Claiming to help neurons fire faster, the headphones are supposed to help gamers overclock their brains by passing an electrical current through the prefrontal cortex. Encourage your prefrontal cortex and get the edge on online gaming, says Foc.us website. Stimulation of the transcranial current, as the practice is called, has been used to treat patients with depression and brain injuries. Some possible use cases for the technology include helping students learn a new language or training drone controllers to better guide drones. Foc.us worn on the head for five to 10 minutes, although it is not clear how long the results last. Some early reviews of the original show that there are lingering effects, even after removing the headset. Nicole Engadget of Lee said she experienced a burning and tingling sensation with Foc.us: We tied the headphones to ourselves at a recent event, and we found it to be a strange experience. There was a strange, almost burning, sensation on the right side of our forehead, while the rest just tingled. Oxley told us that it was normal for some people to feel more on one side than the other, and that tDCS gets some getting used to. After about eight minutes, the tingling sensation remained even after we removed the headphones. We didn't really feel the forces of our concentration improving so much later, but it's hard to say after such a limited time. Meanwhile, Megan Geuss at Ars Technica mentioned seeing points: It fits comfortably and the headphones have a boot crescendo, so it wasn't jerking (pun intended) when the headphones turned on. Unfortunately, Foc.us didn't have a gaming rig set up on demo day, so I can't tell you if it really improves performance. I can say that I started to feel a very noticeable but somewhat pleasant shock in the back left of my brain, except for a slight buzzy feeling all over my head. I also started seeing white spots on my peripheral vision, especially on my upper right side. If you are epileptic, do not use this headset. Foc.us that the headset meets the required regulatory standards. However, without FDA approval, it likely faces roadblocks, if not because some people may be wary of shocking them their to improve their gaming skills (how much are the bragging rights worth, exactly?), then because users can look as ridiculous as the above models. still, Foc.us is preparing to ship this month for \$279. [Pictures: Foc.us] RD.COM Knowledge Brain GamesEvery publishing product is selected independently, although you may be compensated or receive an affiliate commission if you purchase something through our links. through walmart.com (3)Only a week or so in you may have already begun to notice how a shift in your daily routine (hello, working from home to jammies) or responsibilities (home schooling, care, and cooking) negatively affects your movement, focus, memory, creativity, and problem-solving skills.
